

# FINAL PROJECT REPORT

*High-Frequency Trading (HFT) - Cryptocurrency*

## ABSTRACT

High-frequency traders' primary objective is to capitalize on ephemeral market situations and earn modest returns on each deal. HFT traders seek to build up profits over time by carrying out many deals in a short amount of time. Slight price differences caused by market imbalances, transient supply- demand mismatches, or other market inefficiencies typically result in gains.

## The Product or Service:

### Product/Service Description:

High-Frequency Trading (HFT) is a method of trading that uses robust computer programs to transact many orders in fractions of a second. Our product is also an HFT for cryptocurrency. The primary objective of this HFT system is to generate profits by employing automated trading strategies that leverage real-time market data and execute trades rapidly. Specific objectives will depend on the chosen trading strategy and the goals of the trading firm but may include the following:

1. Maximizing profits through rapid trade execution.
2. Minimizing risk by implementing effective risk management strategies.
3. Exploiting market inefficiencies by identifying and capitalizing on price discrepancies.
4. Providing liquidity to the market by quickly responding to changes in supply and demand.

Ultimately, the HFT system aims to offer users a competitive advantage over other market participants by utilizing advanced technology to execute trades more efficiently and at higher

speeds. High-speed trade execution, a staggering volume of transactions, and a relatively short

investment horizon are all characteristics of high-frequency trading (HFT), an algorithmic form of trading. HFT uses specialized computers to execute trades as quickly as feasible. Due

to its

complexity, it is usually used by large institutional investors like hedge funds and investment banks.

Because of the cryptocurrency markets' extreme volatility and round-the-clock nature,

HFT has grown increasingly common.

However, HFT is a complicated and fiercely competitive trading approach that

### Gap in the market:

necessitates

**Liquidity provision:** A vast number of buy and sell orders placed by HFT businesses on significant infrastructure expenditures. The primary users are institutional investors and volatility, specialized trading of futures gaps, the means available by which hedge funds and other market players by supplying liquidity.

**Market responsiveness** : HFT contributes to increased market responsiveness by responding swiftly to changes in market conditions and prices. Using high-speed algorithms, HFT traders can spot and take advantage of transient market imperfections, such as price differences across exchanges or mispricing between linked assets. HFT can assist in hastening the process of bringing prices closer to their actual value by taking advantage of these inefficiencies.

- **Price discovery:** In the Bitcoin market, HFT can improve price discovery. HFT algorithms can digest massive amounts of information and respond to news or events more quickly than human traders since they continuously monitor and analyze market data. The capacity to swiftly adjust pricing in response to added information can help estimate market prices more precisely.
- **Unpredictable opportunities:** HFT is frequently used to exploit arbitrage possibilities resulting from price discrepancies between several cryptocurrency exchanges. HFT companies can profit from the transient imbalances before their correction by quickly spotting and taking advantage of these pricing disparities. This lessens market inefficiencies and aligns pricing across exchanges.

## Market in Monetary terms and existing alternatives:

The entire market value of the cryptocurrency industry has increased substantially in recent years, occasionally reaching hundreds of billions or even trillions of dollars. High-frequency trading is a subset of this wider industry. However, it can be difficult to estimate its precise financial scale due to the need for more transparency and the private nature of HFT businesses' operations.

There are many additional trading tactics used by market players in the cryptocurrency market as alternatives to high-frequency trading:

- **Day trading:** During a single trading day, traders try to profit from swift price changes. They use market patterns and technical indications to decide whether to purchase or sell. Day trading does not rely on high-frequency order placement or ultra-high-speed execution as HFT does.
- **Swing Trading:** Swing traders seek to profit from moderate price fluctuations that may span a few days to many weeks. To spot future trading opportunities, they examine both technical and fundamental elements. Compared to HFT, swing trading includes holding positions for a more extended period.
- **Long-Term Investing:** Long-term cryptocurrency investors use a buy-and-hold strategy and hold their investments for weeks, months, or even years. They evaluate the viability of projects and the long-term prospects of cryptocurrencies before making their investment selections.
- **Market Making:** Market makers give the market liquidity by consistently quoting buy and sell prices for cryptocurrencies. They gain from the bid-ask spread and work to reduce it as much as possible to improve market efficiency. Market making may not be as high-frequency or latency-dependent as HFT, but it may entail automated trading tactics.

## Customer Mix, CLV and Customer Equity:

**Business Plan:** High-Frequency Trading in Blockchain (Subscription-based Model)

### Target Customer:

Our target customers are institutional investors, hedge funds, and financial institutions that actively participate in cryptocurrency trading and seek to leverage high-frequency trading strategies on the blockchain. These customers typically have a significant trading volume and require advanced trading tools and platforms to execute their strategies effectively.

### Customer Mix Strategy:

- a) **Customer Acquisition:** We will employ a multi-channel approach to acquire customers, including targeted digital marketing campaigns, industry partnerships, attending blockchain conferences, and leveraging industry thought leadership. We will also utilize referral programs to encourage existing customers to refer to new clients.
- b) **Customer Development:** Our customer development strategy will focus on continuous improvement of our trading platform, providing regular updates with new features and functionalities based on customer feedback. We will also offer personalized customer support, training sessions, and educational resources to help customers optimize their trading strategies.
- c) **Customer Retention:** Customer retention will be a priority. We will maintain regular communication with our customers, ensuring timely responses to their queries and concerns. Providing exceptional customer service and proactive account management will contribute to a strong relationship and long-term loyalty.

### Market Research and Customer Mix Numbers:

Market research indicates that the average customer acquisition cost in the high-frequency trading blockchain industry ranges from \$5,000 to \$20,000. Retention rates typically range between 80% and 90%, depending on the quality of service and platform performance. Profit margins, on average, range between 30% and 40%.

### Customer Lifetime Value (CLV) Calculation:

CLV can be calculated by multiplying the average profit margin by the average customer retention rate and dividing it by the difference between the discount rate and the retention rate. For example, assuming a profit margin of 35%, a retention rate of 85%, and a discount rate of 10%:

$$CLV = (0.35 * 0.85) / (0.10 - 0.85) = 0.297 / 0.75 = \$0.396 \text{ million}$$

Based on the provided market research data, let us make some assumptions to calculate the 5-year Customer Equity for our high-frequency trading blockchain company:

### Assumptions:

Average customer acquisition cost:  
\$10,000 Retention rate: 85% Profit  
margin: 35% Discount rate: 10% Annual  
customer growth: 10%

### Calculation:

Calculated the Customer Lifetime Value (CLV) using the formula:  $CLV = (\text{Profit Margin} * \text{Retention Rate}) / (\text{Discount Rate} - \text{Retention Rate})$   $CLV = (0.35 * 0.85) / (0.10 - 0.85)$   $CLV = 0.297 / 0.75$   $CLV = \$0.396$  million

Calculated the 5-year Customer Equity:  $\text{Customer Equity} = CLV * (1 + \text{Annual Growth Rate})$

^

Number of Years  $\text{Customer Equity} = \$0.396 \text{ million} * (1 + 0.10)^5$   $\text{Customer Equity} =$   
 $\$0.396$   
 $\text{million} * 1.61051$   $\text{Customer Equity} = \$0.638$  million Therefore, based on the assumptions

and calculations, our projected 5-year Customer Equity for  
our high-frequency trading blockchain company is approximately \$0.638 million.

Based on market analysis and industry reports, the projected market size for high-

frequency

trading in the blockchain industry was estimated to be 7.4billion in 2022 and is poised to  
generate revenue over 94 billion by the end of 2027 projecting a CAGR of 66% from 2022-  
2027The competition in this market is significant, with several established players offering  
similar services. However, our unique value proposition and focus on customer-centric

solutions

differentiate us from the competition. Some of the biggest high-frequency trading firms  
include

Citadel Securities, Virtu Financial, Two Sigma Securities, DRW, and Hudson River Trading.

## Revenue Model:

### Sales model:

Business-to-business (B2B) transactions usually follow a standardized sales process that involves presenting goods or services to other companies. Multiple phases and interactions between the vendor and the customer are frequently included in B2B sales processes. The B2B sales model has the following essential components:

- **Prospecting and lead generation:** These two steps usually come first in sales. This entails locating potential clients who could require the goods or services provided. Cold calling, networking, referrals, internet lead generating, and attending industry events are all examples of prospecting techniques.
- **Needs Evaluation and Solution Design:** The salesman performs a needs evaluation after identifying a potential customer. This entails comprehending the client's unique needs, problems, and business goals. The salesman acquires information by actively listening and probing to provide a solution specifically customized to the customer's demands.
- **Presentation:** The salesman creates a proposal or presentation outlining the suggested solution based on the needs analysis. The proposal usually contains information on the product's specifications, cost, schedule for deployment, and possible advantages for the client's enterprise. The salesperson may provide the proposition verbally, visually, or via other means of communication.
- **Contracting:** After the proposal, the salesman may negotiate with the customer to resolve any queries or demands. In this phase, terms, including price, payment terms, delivery schedules, and contractual duties, must be mutually acceptable. Multiple rounds of discussion may be involved in negotiation before both sides reach a mutually agreeable conclusion.
- **Closing the transaction:** Securing the customer's agreement to proceed with the purchase and completing the terms of the agreement constitute closing the transaction. This can entail signing a contract or purchase order, getting any required permissions inside the customer's company, and resolving last-minute issues or objections.
- **Implementation and Customer Success:** After the transaction, the emphasis switches to ensure a seamless delivery of the goods or services. This is known as implementation. This step entails collaboration between the sales team, customer support, and other pertinent departments to guarantee a successful onboarding process. To foster long-term connections and prospective chances for upselling or cross-selling, ongoing customer success and support are also crucial.
- **Account management and client relationship:** Development is essential to B2B sales. Account managers or customer success teams must manage and foster these connections. They endeavor to maintain customers' pleasure, ensure their retention, and pursue any challenges or possibilities for probable future business.

## Revenue Streams:

A high-frequency trading (HFT) cryptocurrency model's primary source of income is the trading activities and tactics used by the HFT business. These are some possible sources of income for HFT bitcoin trading:

- **Trading Profits:** For HFT companies, their primary income source comes from their trading profits. HFT algorithms are made to spot and seize chances for arbitrage based on short-term price disparities, market inefficiencies, or other factors. HFT businesses seek to generate modest gains on each trade by rapidly carrying out many transactions. When added together, these little earnings might add up to a lot over time.
- **Market Making:** HFT companies may participate in market-making operations, providing the bitcoin markets liquidity. HFT traders benefit from the bid-ask spread by continually quoting both buy and sell prices. Market makers strive to reduce the spread, boost market performance, and profit from transactional flow.
- **Rebates and Incentives:** Some cryptocurrency exchanges provide HFT companies with rebates or incentives to boost trade volumes on their platforms and supply liquidity. These refunds often represent a portion of the trading commissions that other market participants must pay. HFT companies can increase their income by utilizing such incentives.
- **Co-location and Data Services:** HFT businesses frequently need ultra-low latency infrastructure and direct market access to execute transactions swiftly. Exchanges for cryptocurrencies may provide co-location services, allowing HFT companies to keep their trading servers near the exchange's servers. Additionally, HFT companies could pay for premium data services like order book depth data or direct market data feeds, which might bring in money for the exchanges.
- **Technology Licensing or Consulting:** HFT enterprises that have created their infrastructure, technology, or trading algorithms may make money by selling or granting licenses to other market players for their technology. Additionally, they can offer consulting services to help other businesses set up or enhance their HFT capabilities.

## Cost:

- Data - 5k - 50k
- Servers: 2k
- Collocation/Cross-connection: Reducing latency - 8k.
- Software: Most expensive - 10k - 20k
- People Resources: 150k/year = 12.5k

Total Cost: 40k/month

## Revenue Model:

1. **Fixed Recurring Fee:** To continue accessing HFT services, clients must pay a fixed amount regularly, such as monthly or yearly. Typically, the fee is fixed and unaffected by trading volume or the number of trades executed.

2. **HFT Infrastructure:** Customers can access high-speed trading platforms, data feed and connectivity options offered by the HFT service provider. This enables them to use high-speed trading tactics and execute deals with minimal delay.
3. **Software and Algorithm:** A common feature of subscription based HFT models is access to exclusive software and algorithmic trading tools. The service provider may have created specific trading techniques, risk management systems, execution algorithms, or enhanced order routing capabilities.
4. **Customer Support/Maintenance:** Regular technical support and upkeep services for the HFT hardware and software are provided to subscribers. This might involve updates, troubleshooting, and help with trading strategy optimization. Depending on the number of subscriptions, the degree of assistance may change.
5. **Customization:** To meet the diverse demands of customers, subscription-based models might provide several tiers or degrees of service. Higher-level subscriptions could offer more features, customization possibilities, or priority support. Thanks to this, customers may now select a membership level that fits their unique needs and trade volume.
6. **Cost Predictability:** With a subscription-based strategy, clients have more predictable monthly expenses, as they pay a defined sum. Compared to pricing models based on trade volume or execution costs, this can aid in budgeting and financial planning.

Overall, we are looking to charge \$60,000/month for the total subscription fee and customization will be extra (based on the ask). We think our price is justified based on our CLV and Customer Acquisition cost. Since it is a properly planned business, we are looking to have an 85% acquisition rate.

## Go to Market Strategy:

### Marketing strategy:

As a high-frequency trading Blockchain company, our go-to-market strategy and marketing initiatives are designed to attract customers and establish a strong presence in the industry. Here is an overview of our marketing strategy and key initiatives:

- **Targeted Marketing:** We will identify and target specific segments within the blockchain industry, such as institutional investors, cryptocurrency exchanges, and financial institutions. By understanding their needs and pain points, we will tailor our marketing messages and channels to effectively reach and engage with these audiences.
  - **Thought Leadership Content:** We will position ourselves as thought leaders by creating and sharing valuable content that demonstrates our expertise in high-frequency trading. Through whitepapers, research reports, blog posts, and educational resources, we will provide insights and highlight the advantages of our platform. This content will be distributed through various channels, including social media, industry forums, and online communities.
  - **Strategic Partnerships:** Collaborating with relevant industry partners will be a key part of our marketing strategy. We will seek partnerships with blockchain technology providers, financial data providers, and industry associations to expand our reach and enhance credibility. Joint marketing efforts, co-hosted events, and cross-promotion will help us attract customers and build a strong network.
  - **Product Demonstrations and Webinars:** We will conduct live product demonstrations and host webinars to display the features and benefits of our high-frequency trading platform. These sessions will provide potential customers with insights into how our solution can enhance their trading strategies, improve efficiency, and deliver superior results. Feedback and questions will be addressed promptly to ensure customer satisfaction.
  - **Online Advertising:** To raise awareness and drive traffic to our website, we will implement targeted online advertising campaigns. Platforms such as Google Ads, social media advertising, and industry-specific websites will be leveraged to reach our target audience. Performance metrics will be closely monitored, and adjustments will be made to optimize the effectiveness of our advertising strategy.
  - **Referral and Affiliate Programs:** We will incentivize our existing customers and industry influencers to refer new customers through referral programs. Rewards and discounts will be offered for successful referrals. Additionally, we will establish an affiliate program to collaborate with influential individuals or organizations in the blockchain and trading space.
- Events and Conferences:** Participation in industry conferences, trade shows, and networking events will be a priority. These platforms will allow us to connect with potential customers, investors, and industry experts. Hosting our own events and

sponsoring relevant industry gatherings will also help increase brand visibility and generate leads.

- **Continuous improvement:** By continuously monitoring the performance of our marketing initiatives, analyzing customer feedback, and staying informed about market trends and competition, we will refine our marketing approach and strive to stay ahead in the high-frequency trading blockchain industry.

## Business Objective:

### Top business priority.

Our primary business focus is developing continuous and long-term profitability in high-frequency trading (HFT) bitcoin. This entails maximizing returns on capital spent while optimizing trading techniques and risk management. We want to become a dominant force in the market by constantly outpacing benchmarks and producing superior trading outcomes. We also prioritize keeping up with industry trends, adjusting to shifting market conditions, and retaining a competitive advantage through innovation, technical breakthroughs, and strategic alliances. Our primary goal is establishing a solid reputation for dependability, effectiveness, and financial success in the HFT cryptocurrency market.

### Background:

The primary objective of high-frequency traders (HFTs) in the cryptocurrency market is to achieve profitability, gain a competitive advantage, and reduce latency in trade execution. HFTs employ speed, advanced technology, and sophisticated algorithms to exploit small price discrepancies and short-term market inefficiencies. By analyzing market patterns, identifying price discrepancies, and leveraging automated trading strategies, HFTs aim to generate profits through high-frequency, volume-based trading while minimizing their holding period. This report addresses the business priority of achieving profitability, competitive advantage, and latency reduction in the context of high-frequency crypto trading.

### Business Objective:

The top business priority for HFT firms is to maximize profitability by capitalizing on the unique characteristics of the cryptocurrency market. Speed, accuracy, technological infrastructure, and latency reduction are key factors that determine success in this domain. By executing trades at lightning-fast speeds, HFTs aim to secure profits from temporary price differences across exchanges or within the same exchange. The primary objective is to accumulate small but consistent profits over time by scalping on each trade and leveraging high trading volumes, while also minimizing latency to gain a competitive edge.

### Key Strategies for Profitability, Competitive Advantage, and Latency Reduction:

#### Advanced Data Analysis and Algorithmic Techniques:

HFTs invest heavily in advanced algorithms and data analysis techniques to detect market patterns and trends. By analyzing several factors such as price movements, order book data, news, and other market indicators, they gain insights that help identify potential trading opportunities. The ability to analyze large volumes of data quickly and accurately is crucial for making informed trading decisions and reducing latency.

### Rapid Trade Execution and Low-Latency Infrastructure:

Minimizing latency is a critical aspect of HFT strategies. HFT firms employ innovative technology and robust infrastructure to execute trades within milliseconds or even microseconds. By leveraging high-speed trading platforms, low-latency networking systems, optimized hardware, and direct market access (DMA) connections, HFTs reduce the time delay in trade execution, gaining a competitive advantage.

### Market Making and Liquidity Provision:

Some HFT firms act as market makers, providing liquidity to the cryptocurrency market. By constantly placing buy-and-sell orders, they contribute to market stability and earn profits from the bid-ask spread. Market-making strategies involve adjusting orders dynamically based on market conditions to ensure efficient price discovery, enhance trading opportunities, and maintain low-latency execution.

### Technological Innovation and Infrastructure Investment:

To maintain a competitive advantage and reduce latency, HFT firms continuously invest in technological innovation and infrastructure. This includes leveraging high-speed trading platforms, advanced networking systems, low-latency data feeds, optimized hardware, and colocation services near cryptocurrency exchanges. By staying at the forefront of technological advancements, HFTs can enhance their trading capabilities, reduce execution times, minimize latency, and gain an edge over competitors.

In the high-frequency crypto trading landscape, achieving profitability, competitive advantage, and latency reduction requires a multi-faceted approach. By combining advanced data analysis techniques, rapid trade execution and continuous technological innovation, HFT firms can maximize their profits while minimizing latency in trade execution. The ability to swiftly identify and exploit price discrepancies, maintain low-latency infrastructure, and robust risk controls positions HFTs to thrive in the dynamic and fast-paced cryptocurrency market, achieving their business objectives while gaining a competitive edge.

## Key Actionable Business Initiative - Analytics Plan:

**Key Actionable Business Initiative:** Implementing a Proprietary High-Frequency Trading Algorithm.

### Introduction:

In our pursuit of building high-frequency trading (HFT) models, we discovered a strong correlation between the quality and frequency of data and the performance of our models. As HFT trading leverages price discrepancies between different exchanges and necessitates rapid buying and selling of stocks within fractions of seconds, the availability and reliability of data significantly influence our predictive capability. We explored two primary approaches for building HFT models: 1. Utilizing a traditional time series analysis, 2. employing neural networks such as RNNs and LSTMs to build predictive models.

However, the use of time series analysis posed challenges due to sparse data, limiting our ability to effectively scrape only 5000 data points. This limitation adversely affected the performance of our ARIMA models, as the extended period between consecutive records introduced significant obstacles. To overcome these limitations, we propose the implementation of a proprietary high-frequency trading algorithm using LSTMs as the most impactful business initiative, focusing on data resampling, and leveraging advanced predictive methods.

### Key Actionable Business Initiative:

Our key actionable business initiative is to develop and implement a proprietary high-frequency trading algorithm that addresses the challenges associated with data quality and frequency, enabling enhanced predictive capability. The algorithm will incorporate the following steps:

#### Why not just interpolate?

While interpolation may seem like a straightforward solution for handling sparse data, there are several factors that need to be considered. The assumption that the interpolated data behaves monotonically between measurements often does not hold, leading to undesired artifacts during feature transformation and potentially impacting model performance. Furthermore, the distribution and variance of time differences (dt) between data points when assessed were relatively large and exhibited non-uniform variance, thus we decided that interpolation may not be the most suitable approach.

We tried Data Resampling first: Instead of relying solely on the sparse data captured through the API, we employed resampling techniques to generate a uniformly sampled grid. This approach allows for the application of standard methods and mitigated the limitations caused by the non-monotonic behavior between measurements in the interpolated data.

## Advanced Predictive Methods & Model Optimization:

To address the limitations of sparse data, we further explored advanced predictive methods such as Recurrent Neural Networks (RNNs) and Long Short-Term Memory (LSTM) models. These models are well-suited for learning historical trends and predicting future values in sequential data. By leveraging the capabilities of RNNs and LSTMs, we can capture the complex dependencies and patterns present in high-frequency trading data.

Additionally, we also focused on model optimization to enhance the performance and predictive capability of our algorithm. This includes fine-tuning the architecture of the neural network models, selecting appropriate hyperparameters, and implementing regularization techniques to prevent overfitting. By continually optimizing our models, we aim to improve the accuracy and reliability of our high-frequency trading algorithm.

By implementing a proprietary high-frequency trading algorithm that addresses data quality and frequency challenges, we aim to significantly enhance our predictive capability in exploiting price discrepancies between different exchanges. Through data resampling techniques, leveraging advanced predictive methods, and continuous optimization, we expect our algorithm to outperform traditional models in handling sparse data and delivering actionable insights for high-frequency trading strategies. This initiative will position us for increased profitability and competitive advantage in the dynamic world of HFT trading.

## Metrics of Success/KPIs:

To evaluate the degree of success of the HFT initiative, the following key metrics can be prioritized:

1. **Profitability per Trade:** This metric measures the net profit or loss generated from each executed trade. It provides an assessment of the effectiveness of the trading algorithm in generating consistent and positive returns.
2. **Winning Trade Percentage:** This metric represents the proportion of profitable trades out of the total executed trades. It indicates the algorithm's ability to accurately predict market movements and generate positive returns.
3. **Accuracy of the Model:** This metric assesses the accuracy of the trading decisions made by the HFT predictive model by measuring the model's ability to correctly predict market movements and execute trades accordingly. Metrics such as validation loss, Root Mean Squared Error (RMSE), and Mean Squared Error (MSE) can be captured to

a. **Validation Loss:** Validation loss is a metric that measures the error to quantify the model's trading accuracy.

predicted and actual values during the model training process. It provides an indication of how well the model generalizes to unseen data. A lower validation loss suggests that the model is accurately predicting market movements and making informed trading decisions.

b. **RMSE:** Root Mean Squared Error is a metric that calculates the square root of the average of the squared differences between the predicted and actual values. It provides a measure of the average prediction error. A lower RMSE indicates that the model is making more accurate predictions, reflecting its ability to capture market movements and execute trades accordingly.

## Hypotheses for how the business initiative will impact these metrics:

1. **Profitability per Trade:** The hypothesis is that by utilizing the HFT predictive model, the profitability per trade will increase compared to manual trading methods. The algorithm's ability to identify profitable trading opportunities and exploit price discrepancies will lead to higher net profits.

2. **Winning Trade Percentage:** The hypothesis is that the HFT predictive model will have a higher winning trade percentage compared to manual trading methods. The model's ability to accurately predict market movements and exploit short-term inefficiencies will result in a larger proportion of profitable trades.

3. **Trading Accuracy:** The hypothesis is that the HFT predictive model will have a higher trading accuracy compared to manual trading methods. The algorithm's ability to analyze large volumes of data, identify patterns and trends, and make informed trading decisions will lead to a higher accuracy in predicting market movements and capturing profitable trading opportunities.

By focusing on these metrics and striving for improvement in profitability per trade, winning trade percentage, and trading accuracy, the HFT initiative aims to achieve a higher degree of success in generating consistent profits and gaining a competitive edge in high-frequency crypto trading.

## Role of Analytics:

By allowing data-driven decision-making, assessing, and improving performance, successfully managing risks, supplying market insights, and fostering continuous development, analytics brings value to our organization. We improve our trading skills, raise profitability, and keep a competitive edge in the fast-paced world of HFT bitcoin trading by utilizing the power of analytics.

## Role of Analytics in the Implementation of a Proprietary High-Frequency Trading Algorithm

Analytics plays a crucial role in the successful implementation of our key actionable business initiative: implementing a proprietary high-frequency trading (HFT) algorithm. In this report, we will explore how analytics will add value to our initiative, enable its execution, aid in ideation and refinement, and help evaluate its success.

## How Analytics will Add Value:

Analytics will add value to our HFT initiative in multiple ways:

- a) **Enhanced Data Analysis:** Analytics techniques enable us to extract meaningful insights from large and complex datasets. By leveraging advanced analytical tools and algorithms, we can uncover patterns, trends, and anomalies in high-frequency trading data. These insights can guide the development of our trading algorithm and improve its performance.
- b) **Predictive Modeling:** Analytics allows us to build accurate predictive models using techniques such as time series analysis, neural networks (RNNs and LSTMs), and other advanced methods. These models can capture the underlying patterns in historical trading data and make informed predictions about future price movements. By incorporating analytics-driven predictive models into our algorithm, we can enhance its ability to identify profitable trading opportunities.
- c) **Risk Management:** Analytics plays a vital role in risk management within the HFT domain. By analyzing historical data and market conditions, we can assess and mitigate potential risks associated with high-frequency trading strategies. Analytics-driven risk management techniques enable us to make more informed decisions and minimize the impact of adverse market events.

## Enabling the Business Initiative:

### Implementing the backbone proprietary algorithm

Analytics is a key enabler of our business initiative to implement a proprietary HFT algorithm. Through data analysis, modeling, and risk management, analytics provides the foundation for developing a robust and effective algorithm. It enables us to leverage data-driven insights, optimize trading strategies, and capitalize on price discrepancies in real-time. Without analytics, the development and execution of our HFT initiative would be significantly constrained.

### Ideation and Refinement:

Analytics plays a crucial role in ideation and refinement throughout the implementation process. By analyzing market data, historical trends, and trading patterns, analytics helps us generate innovative ideas for enhancing our algorithm and improving trading performance. Through iterative analysis and refinement, we can identify opportunities for algorithmic optimization, feature engineering, and model fine-tuning. Analytics-driven insights empower us to continually iterate and evolve our HFT algorithm to adapt to changing market dynamics.

### Evaluating the Success of the Business Initiative

Analytics serves as a powerful tool for evaluating the success of our HFT initiative. Key metrics and indicators can be tracked to assess the performance and effectiveness of the algorithm. These metrics include:

- a) **Profitability per Trade:** By analyzing the net profit or loss generated from each executed trade, we can evaluate the algorithm's ability to generate consistent and positive returns. Increased profitability per trade indicates the algorithm's effectiveness in identifying profitable opportunities.
- b) **Winning Trade Percentage:** This metric measures the proportion of profitable trade out of the total executed trades. A higher winning trade percentage suggests the algorithm's ability to accurately predict market movements and generate positive returns.
- c) **Trading Accuracy:** Metrics such as validation loss, Root Mean Squared Error (RMSE), and Mean Squared Error (MSE) can be captured to measure the accuracy of the trading decisions made by the HFT algorithm. Lower validation loss, RMSE, and MSE values indicate higher trading accuracy.

By monitoring these metrics, we can assess the success of our business initiative. The hypothesis is that the implementation of our proprietary HFT algorithm, empowered by analytics, will lead to increased profitability per trade, a higher winning trade percentage, and improved trading accuracy compared to manual trading methods.

Analytics plays a pivotal role in the implementation of our proprietary high-frequency trading algorithm. It adds value by enhancing data analysis, enabling predictive modeling, and facilitating risk management. Analytics is instrumental in ideation and refinement, as well as evaluating the success of our business initiative. By leveraging analytics-driven insights, we aim to outperform traditional models, capitalize on price discrepancies, and achieve increased profitability and competitive advantage in the dynamic world of HFT trading.

## Analytics Methodology:

- 1. Data Source:** The dataset used in the analytics plan relies on existing observational data rather than designing and running experiments. The data is obtained from Live Coin Watch through an API at regular intervals of 60 seconds, which provides market data for various cryptocurrencies.
- 2. Time Series Data:** The data is organized as a time series, capturing information over a specific period. The data is extracted at regular intervals of 60 seconds, ensuring frequent updates and accuracy. The training data spans from January 1st, 2017, to May 27th, 2023, providing a substantial historical record. The unseen/test data covers the period from May 30th, 2023, until the present day, allowing for analysis of latest trends and patterns in the market.
- 3. Variables:** The dataset consists of four key variables: Rate, liquidity, market capital, and time. These variables provide information on the price, liquidity, market capitalization, and time of each cryptocurrency. Additionally, the dataset includes other relevant market variables, technical indicators (e.g., moving averages, relative strength index), order book data, and trading volume as explanatory variables or features.
- 4. Data Variation:** To explore the variation in the data, both the target/outcome variable (profitability of trades) and the explanatory variables/features have been analyzed. Descriptive statistics and visualizations can be used to understand the distribution, trends, and relationships among these variables.
- 5. Target/Outcome Variable:** The target or outcome variable in this analytics plan is the predictions on the cryptocurrency's future value. By making these dynamic predictions on the future values of the cryptocurrency we exploit the price discrepancies to make a profit through High Frequency trading.
- 6. Explanatory Variables/Features:** At present, our predictions on the future value of the cryptocurrency rely solely on historical values and additional features such as rate, liquidity, market capital, and time. However, to enhance the model's performance, several suggestions can be implemented:
  - Firstly, incorporating moving averages, relative strength index, trading volume, order book data, and other pertinent market variables would likely improve the model's accuracy.

- Furthermore, conducting a news sentiment analysis would allow us to effectively capture and account for comprehensive market fluctuations, thereby better capturing the market trends.

Exploring the variation in these variables would involve analyzing their distributions, identifying any outliers, or missing values, examining trends over time, and assessing relationships between the features and the target variable (profitability).

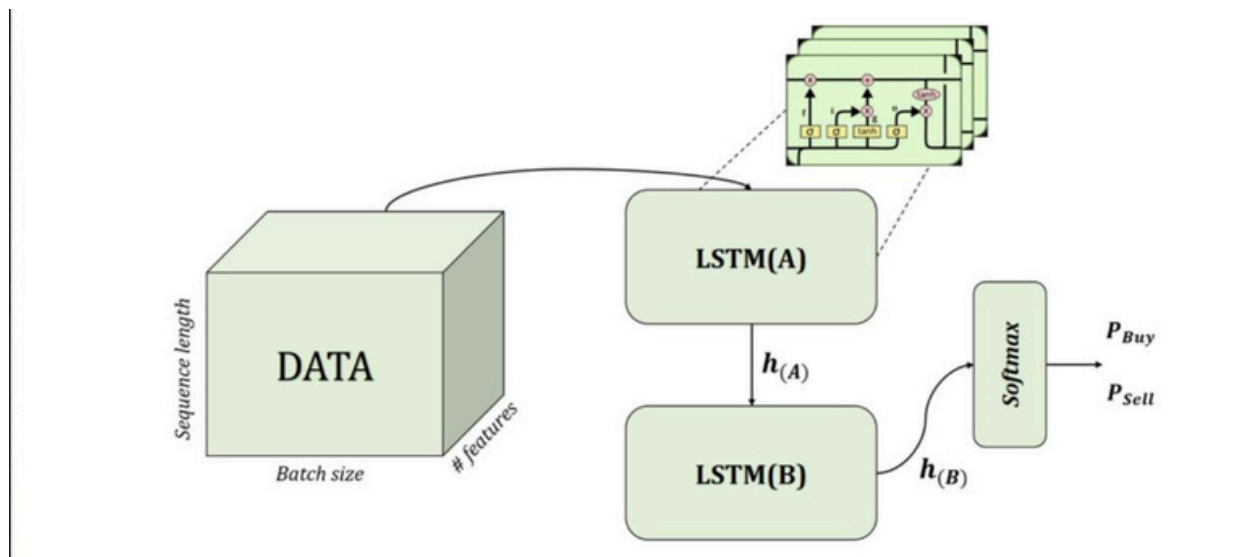

**Predictive Analytics:** Predictive analytics aims to develop models that can accurately predict the future value of the cryptocurrency based on the selected features. The goal is to generate the best possible predictions that closely mirror the true values. The model mentioned in the plan utilizes time series analysis techniques and neural networks such as Long Short-Term Memory (LSTM) and Recurrent Neural Networks (RNN) to forecast trade profitability by capturing underlying patterns and trends.

Future suggestions for Prescriptive Analytics: Prescriptive analytics go beyond predictive analytics by suggesting actions to optimize trading performance, maximize profitability, and we can also optimize to control risk.

## Model Building:

1. **Data Collection:** The model collects historical price data of the BNB cryptocurrency from the Livecoinwatch API. It collects data from the start of the year 2023 to the current timestamp. The data includes the timestamp, rate, volume, market cap, and liquidity. The data is then stored in a MongoDB database.
2. **Data Preprocessing:** The model converts the UNIX timestamp to a readable date format and calculates the difference in seconds between observations. It also normalizes the time difference and rate columns.
3. **Sequence Creation:** The model creates sequences of 60 observations each for the LSTM model. Each sequence is used to predict the next rate.
4. **Model Definition and Training:** The model defines an LSTM model with 50 units and a dense output layer. The model is compiled with the Adam optimizer and mean squared error loss function. The model is then trained in sequences.
1. **Data Collection for Prediction:** The model collects unseen data of the BNB cryptocurrency from the Livecoinwatch API, starting from a specified date (May 29, 2023). This data is stored in a separate MongoDB collection.
2. **Prediction:** The model preprocesses the unseen data in the same way as the training data and creates sequences. It then uses the trained LSTM model to predict the rates for the unseen data.
3. **Evaluation:** The model calculates the mean squared error, root mean squared error, and loss between the predicted rates and the actual rates for the unseen data.

Future suggestion for model architecture:

**Predictive Analytics:** Our model utilizes historical data of cryptocurrency prices to predict future prices. This approach enables us to be proactive and forward-looking in our decision-making, which is the core of predictive analytics. The LSTM layers in our model learn the patterns in the time series data and use this knowledge to make predictions about future prices. The most informative features in this case are the historical prices and the time differences between observations. We have clearly designed our model as a time series prediction model using LSTM layers.

If we were to extend this model to suggest trading actions (buy, sell, hold) based on the predicted price changes, then it would also involve Prescriptive Analytics. However, establishing a causal relationship between the predicted price changes and the trading outcomes would be challenging, especially since the cryptocurrency market is influenced by many factors that are not included in the model.

**Prescriptive Analytics:** If we were to extend our model to suggest trading actions (buy, sell, hold) based on the predicted price changes, then it would also involve prescriptive analytics. However, establishing a causal relationship between the predicted price changes and the trading outcomes would be challenging, especially since the cryptocurrency market is influenced by many factors that are not included in our model.

If we were to use our model for prescriptive analytics, we would likely be using observational data with controls for confounded situations. We could potentially use the causality checklist to identify possible confounds, such as market trends, news events, and other factors that can influence cryptocurrency prices.

Our ideal future architecture would consist of two LSTM layers, followed by a SoftMax function at the end. The rationale behind this architecture is as follows:

## Two LSTM Layers: Adding another LSTM layer would allow our model

complex features from the data. The first LSTM layer would return a sequence of outputs (one for each time step) to the second LSTM layer. This second LSTM layer would then process this sequence further and return a single output to the next layer. This output would represent the learned features of the input sequence, capturing more complex temporal dependencies than a single LSTM layer.

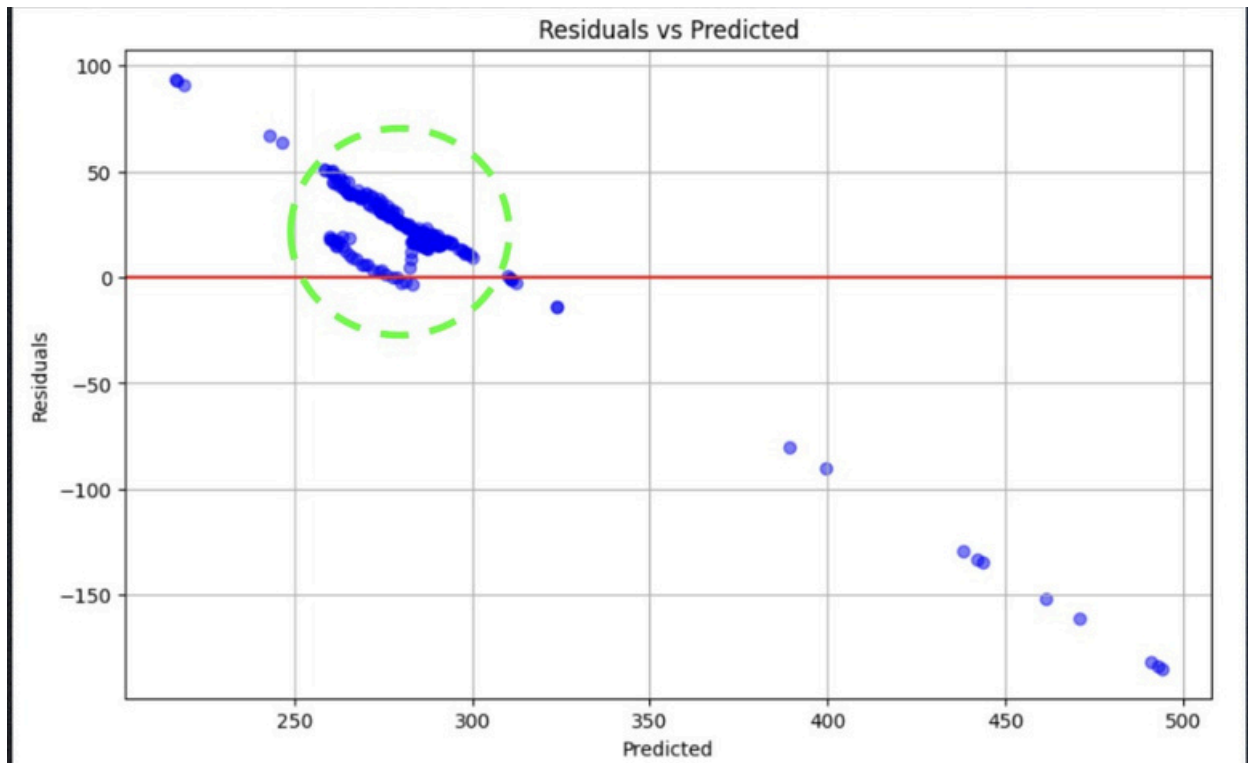

## SoftMax Function: The softmax function is an activation function that

of a neural network layer into probabilities that sum up to one. This makes it suitable for multi-class classification problems. In our case, we could transform our continuous price prediction problem into a classification problem. For example, we could classify price changes as "increase", "decrease", or "no change". The SoftMax function in the output layer would then predict the probability of each class based on the learned features of the input sequence. This architecture would enable our model to predict not just the future price, but also the likely direction of the price change. This could be particularly useful for high-frequency trading strategies, where the direction of the price change is often more important than the exact price.

## Main Analytics Results:

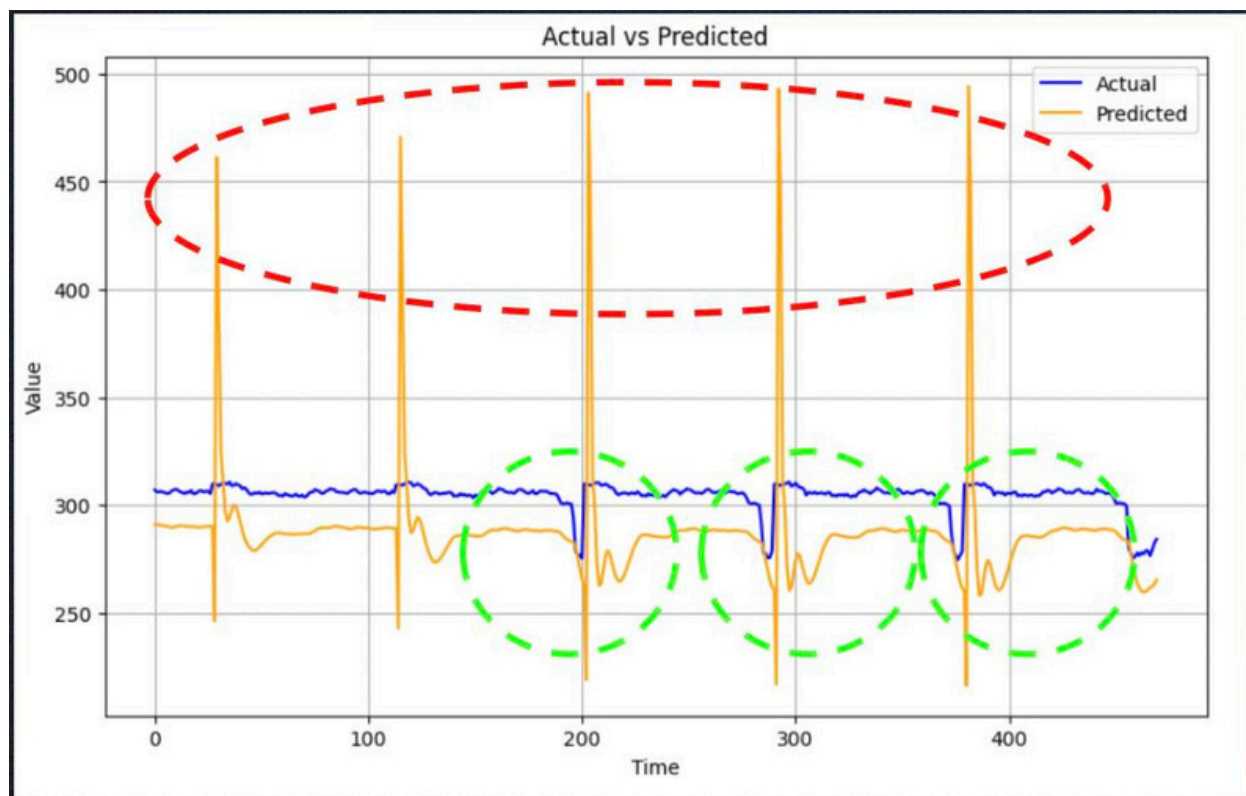

### Validation:

Interesting findings from Residual Vs. Fitted Plot:

- Residuals represent the disparities between the actual values and the model's predicted values.
- Most observations exhibit a scattered random distribution near the zero line (red line), apart from a few points in the bottom right and top left corners. This pattern, highlighted by the green dotted circle, aligns with the expected ideal pattern.
- The relationship between the residuals and predicted values can be attributed to the model's ability to capture certain seasonal trends, which can be observed in the detailed Actual Vs Predicted screenshot provided above.

## Interesting findings from Actual Vs. Predicted line plot

- The Actual Vs Predicted plot demonstrates the model's close alignment with the actual values, as evidenced by many green dotted circles.
- In specific time stamps, the model tends to overestimate the price trends immediately after dips, as indicated by the red highlighted circle.
- To enhance accuracy, mitigating these overestimations and deviations is possible by incorporating additional high frequency data through the utilization of more high frequency API connections.

## Results based on success metrics:

### 1. Winning Trade Percentage:

- The analysis reveals a 55% winning trade percentage, indicating that the algorithm achieved a profit in 55% of the executed trades. This finding suggests a moderate success rate in generating profitable trade.
- To enhance the algorithm's performance and further improve predictions on future cryptocurrency values, implementing the suggestions is crucial. These include effectively capturing high frequency data through APIs and incorporating a news sentiment analysis that factors in market trends. By adopting these measures, we can increase the winning percentage and enhance the accuracy of our predictions.

**2. Average Profit per Trade:** The average profit per trade is measured to be 8 cents. This metric represents the average financial gain achieved per individual trade. It provides insight into the profitability potential of the algorithm and indicates the average return on investment for each trade executed.

**3. Model Performance Metrics:** The plan mentions two performance metrics for the predictive model. Firstly, the validation loss is reported as 987.811. This metric reflects the discrepancy between the predicted and actual values during the model's validation process. A lower validation loss indicates better alignment between predicted and actual values, implying higher predictive accuracy. Secondly, the root mean squared error (RMSE) is calculated as 31.42. This metric represents the average magnitude of the differences between the predicted and actual values. A lower RMSE indicates less overall prediction error.

These findings provide valuable insights into the model's performance, trade profitability, and predictive accuracy. The winning trade percentage and average profit per trade metrics give an indication of the algorithm's success in generating profitable trades. However, it is important to note that without further context or benchmark comparisons, it is difficult to assess whether these values are considered high or low within the industry.

Additionally, the model's performance metrics, namely the validation loss and RMSE, provide an assessment of the model's predictive accuracy. A lower validation loss and RMSE suggest that the model is better able to predict trade profitability and has lower prediction error. Overall, these findings indicate that the algorithm shows potential for generating profitable trade and has a certain level of predictive accuracy.

## Executing the Analytics:

### Who will run the models?

This responsibility will be assigned to many individuals and roles. See below:

**Quantitative Analysts:** Also referred to as quants, these professionals are essential to HFT businesses. They are responsible for creating and using complex trading algorithms and models that power the analytics procedure. Quants examine market data, spot trends, and build prediction models to enhance trading tactics using statistical and mathematical methods.

**Data scientists:** Data scientists collaborate with quants to sift through vast amounts of market data and produce insightful findings. They use machine learning, statistical modeling, and advanced data analysis tools to find patterns and trends in the Bitcoin market. Based on their study, data scientists also help to build algorithms and tactics.

**Traders:** Using the insights and indications produced by the analytics team, traders oversee carrying out deals. They keep a careful eye on the state of the market, the size of the order book, and real-time data. Based on market circumstances and algorithm performance, traders collaborate with the analytics team to modify trading strategies and fine-tune parameters.

**Infrastructure Team:** The creation, upkeep, and optimization of the trading systems, platforms, and connections are the responsibility of the technology and infrastructure team. They ensure that the network infrastructure, software, and hardware needed to enable analytics and trading activities are in place. Software developers, network experts, and system administrators could be on this team.

**Risk managers and compliance officers:** They manage risks and ensure that HFT bitcoin trading complies with regulations. They collaborate closely with the analytics team to monitor and manage risks related to trading strategies, algorithmic performance, market volatility, and compliance with pertinent rules and regulations.

**Management and Executives:** Based on the information the analytics team has supplied, management and executives of the HFT cryptocurrency business offer strategic direction, oversee general operations, and make crucial decisions. They rely on the analytics team's results to analyze performance, evaluate risks, and direct the organization's trading plans and objectives. Market Data APIs and tools such as connecting to Bloomberg and API'ing from other data

collection websites such as JP Morgan or BofA.

### Involving analytics in defining success metrics:

**Quantitative analysts and data scientists:** They are essential to developing analytics plans and defining success indicators. They work closely with traders and management to comprehend the trading objectives and find pertinent performance metrics. They suggest and create relevant criteria to assess the efficacy and profitability of trading strategies based on their proficiency in statistical modeling and data analysis. They also assist in using analytical methods and tools to extract useful information from market data.

**Traders:** Since they are thoroughly aware of the trading objectives and goals, traders offer essential input in determining success metrics. They collaborate closely with data scientists and quantitative analysts to define the intended results and metrics that match the organization's

trading strategy. Traders may offer insights on metrics for assessing and enhancing trading performance, such as profitability, risk-adjusted returns, trade execution effectiveness, or market impact. They work together to create analytics frameworks that allow them to make data-driven choices.

**Management and Executives:** As they give strategic direction and establish the overall goals for the HFT cryptocurrency firm, management, and executives are crucial in setting success measures. They collaborate closely with traders, data scientists, and quantitative analysts to match analytics efforts with corporate objectives. Management offers direction on the targeted goals, risk tolerance, and critical performance indicators (KPIs) that will be used to assess the trading strategy's effectiveness. To guarantee that analytics frameworks and metrics align with the organization's larger goals, they also supervise their deployment and evaluation.

To define performance measures and think through analytics in HFT bitcoin trading, collaboration amongst various stakeholders is crucial. Together, they construct meaningful and quantifiable performance indicators that align with the organization's trading objectives by drawing on their subject experience, data analytic skills, and strategic vision. This iterative method continuously evaluates and improves the metrics and analytics tactics to improve trade performance and achieve desired results.

### Impediments in executing analytics:

For this model to be successful, there are many factors (technical and non-technical) that are involved in the success of this project. The following steps are very critical:

**Data Quality and Availability:** Accurate and reliable market data must be made available to analytics to succeed. However, working with several cryptocurrency exchanges and data sources might make ensuring data quality and availability easier. Effective data-gathering procedures, the application of data validation and cleansing methods, and the creation of alliances with dependable data suppliers may all assist in enhancing data quality. Additionally, having redundant systems and backup data sources helps lessen the effects of data failures or discrepancies.

**Issues with Latency and access:** Since HFT methods depend on deficient latency execution, quick and reliable access to cryptocurrency exchanges is necessary. The timely execution of trades and data gathering might need to be improved by latency and network problems. The use of co-location services provided by exchanges, network infrastructure optimization, and high-performance trading platforms and technologies can all address this issue by lowering latency and ensuring dependable connectivity.

**Regulatory and Compliance Considerations:** The HFT industry operates in a regulatory environment that might impose specific requirements and limitations. Compliance with applicable laws and regulations might take much work to achieve. To get around this, it is essential to have a solid grasp of the regulatory landscape and work with legal and compliance professionals to make sure that the analytics strategy and trading techniques adhere to all applicable laws and regulations.

**Complexity of Analytics Models:** Expertise in quantitative analysis, machine learning, and statistical modeling is necessary to develop complex analytics models and algorithms.

Nevertheless, the difficulty of building and maintaining these models can be a barrier. This problem may be solved by assembling a team of knowledgeable quantitative analysts, data scientists, and engineers. Access to specialist information and resources can also be made possible by working with outside consultants or collaborating with academic institutions.

**Market turbulence and shifting circumstances:** The bitcoin market is renowned for its turbulence and swift shifts. The analytics plan must be flexible enough to accommodate changing market circumstances. This problem may be solved by adopting dynamic risk management solutions, including real-time data streams, and continuously monitoring and evaluating the analytics models. Keeping a feedback loop open with traders and implementing their suggestions can also make the analytics strategy more responsive to changing market conditions.

**System Reliability:** High system dependability and resilience levels are necessary for HFT operations to maintain continuous trading and analytics operations. Technical issues, hardware or software bugs, and cyber threats can hamper operations. These risks may be reduced by implementing thorough risk management procedures, regularly auditing the system, using redundancy techniques, and spending money on cybersecurity measures.

## Implementing the Analytics:

### Influence of analytics:

- The analytics offers perceptions of market trends, correlations, and patterns that affect the choice and modification of trading methods. To maximize profitability, lessen the market impact, or improve risk-adjusted returns, traders might adapt their order execution tactics, risk settings, or trading algorithms based on the analytics data. Analytics may also help with choices on the allocation of trading capital, the timing of deals, and the selection of cryptocurrency pairings or other assets to trade.
- Analytics may be instrumental in identifying and controlling the risks connected to HFT bitcoin trading. The findings can show possible risk concentration hotspots, point out anomalous occurrences, or point to market circumstances that must be watched. Risk managers can alter risk limits and mitigate based on analytics results.
- Results from analytics can offer insightful market research and information beyond simple trading decisions. The outcomes might disclose market inefficiencies, arbitrage or spread-capture possibilities, or market dynamics or sentiment changes. This data may support strategic decision-making for projects like product creation, market entrance or growth plans, or finding chances for specialized trade.
- Additionally, the analytics may be used to measure the effectiveness of various cryptocurrency exchanges or the effects of legislative changes on trading approaches. The analytics outcomes reveal places where infrastructure and technology may be improved to increase trade performance and efficiency. For instance, choices may be taken to invest in faster network infrastructure or investigate co-location options to minimize latency if the analytics show latency or connection concerns hurting trade execution.
- Finally, Analytics results offer insightful input on the effectiveness of built models and the success of trading strategies. The outcomes could inspire teams to develop analytics models through iteration and refinement, add new data sources, or investigate other algorithmic strategies. The iterative improvement of trading strategies, risk management frameworks, and overall operational efficiency can result from routine analysis and evaluation of analytics results.

### Implementing Analytics through the organization

Implementing analytics throughout the organization will require careful planning with a 7-step approach:

1. **Analyze Current Workflow:** Analyze the workflow and procedures within the company to find places where analytics may be included. Analyze how analytics might enhance and complement the current risk management techniques, trading methods, and decision-making frameworks. This evaluation will assist in locating any gaps or locations where a new workflow must be developed.
2. **Create a New Workflow:** If the current workflow does not sufficiently include analytics, it could be required to design a new workflow that does. Work with key stakeholders, including traders, data scientists, quantitative analysts, and technology teams, to create a process incorporating analytics at the relevant points. List the duties and functions assigned to each team or person working on the analytics process.

3. **Infrastructure for Data Integration:** Ascertain that the essential infrastructure for data is in place to enable analytics projects. This may entail setting up data processing and storage systems, combining data streams from various sources, and establishing communication with pertinent exchanges and data providers. Work with the technical team to ensure data and analytics tools are seamlessly integrated into current systems.
4. **Analytics Training and Education:** To improve the teams' comprehension and competence in applying the analytics tools and approaches, provide training and education to those teams. Provide workshops, training sessions, and knowledge-sharing events to help people improve their data analysis abilities, statistical modeling methods, and ability to evaluate analytics findings. Promote continual learning and skill development in analytics to keep the teams abreast of the most recent developments.
5. **Collaborative Decision-making:** Foster a culture of collaborative decision-making in which insights from analytics are appreciated and considered when making decisions. Encourage stakeholders from various teams, including traders, data scientists, quantitative analysts, and management, to share and discuss analytics results at frequent talks and brainstorming sessions. This encourages a comprehensive grasp of the consequences of analytics and makes it easier for everyone in the organization to accept and use them.
6. **Measure and Communicate Impact:**
  1. Develop measurements and key performance indicators (KPIs) to gauge how analytics have affected trading efficiency, risk control, and overall profitability.
  2. Maintain regular communication with the appropriate stakeholders and tracking of the results and insights produced by the analytics.
  3. Highlight achievements and emphasize how analytics has affected choices and enhanced trading results.
  4. This increases adoption across the enterprise and contributes to developing trust and confidence in the analytics process.
7. **Iterative Improvement:** Constantly assess and improve the analytics workflow considering input and suggestions from the associated teams. Encourage an iterative strategy for implementing analytics, whereby the lessons discovered from earlier analytics projects are applied to later iterations. Maintain an open mind to criticism, adjust to shifting market conditions, and promote a culture of ongoing analytical development.

## Scaling Up:

Our high-frequency trading blockchain company recognizes the importance of analytics in driving our business initiatives and staying competitive in the market. To ensure the success and scalability of our analytics initiative, we need to address specific organizational challenges that are relevant to our industry. These challenges may include data limitations, people-related issues, system constraints, and cultural barriers. Here is how we plan to address them:

- **Data Challenges:** In the high frequency trading space, accessing high-quality and real-time data is crucial. We will establish strong data partnerships with reputable data providers and exchanges to ensure that we have access to accurate and timely market data. Additionally, we will invest in robust data management systems and implement advanced data processing and cleansing techniques to ensure the integrity and reliability of the data we analyze.
- **People Challenges:** Building a skilled and knowledgeable workforce is essential for leveraging analytics effectively. We will recruit and train professionals with expertise in high-frequency trading, data analysis, and blockchain technology. This will involve hiring quantitative analysts, data scientists, and software engineers with a strong understanding of financial markets and trading algorithms. Continuous training and development programs will be provided to keep our team updated with the latest trends and technologies in the field.
- **System Challenges:** High-frequency trading requires a robust and scalable technological infrastructure. We will invest in high-performance computing systems, low-latency data processing capabilities, and advanced algorithmic trading platforms. By leveraging cloud-based solutions and distributed ledger technology, we can ensure fast and secure transactions while maintaining the scalability needed to handle increasing trading volumes.
- **Cultural Challenges:** Shifting the organizational culture to embrace data-driven decision-making can be a challenge. We will promote a data-driven mindset throughout the company by encouraging collaboration and knowledge sharing. Regular data-driven performance reviews and feedback sessions will be conducted to foster a culture of continuous learning and improvement. We will also establish clear metrics and key performance indicators to track the impact of our analytics initiatives and communicate their value to stakeholders.

By addressing these specific organizational challenges, our high-frequency trading blockchain company can establish a solid foundation for leveraging analytics effectively. We will continuously assess the effectiveness of our analytics processes, invest in technological advancements, and nurture a data-driven culture to drive innovation and success in our business initiatives.
